

ASX ANNOUNCEMENT

Actinogen CEO presentation to ShareCafe investor webinar

Sydney, 21 October 2022. Actinogen Medical ASX: ACW (“ACW” or “the Company”) is pleased to announce its participation in the ShareCafe Small Cap *Hidden Gems* investor webinar, to be held **today** from 12:30pm AEDT / 9:30am AWST.

The webinar can be viewed live via Zoom and will provide investors with the opportunity to hear from and engage with Actinogen’s CEO and Managing Director Dr Steven Gourlay and representatives of other leading ASX-listed micro/mid cap companies.

Dr Gourlay will provide an overview of Actinogen and focus on the Company’s recent positive Alzheimer’s Disease (AD) Phase 2a trial results that showed a strong clinical effect from its lead compound Xanamem¹ and a major validation of the ‘cortisol hypothesis’ for AD.

To access further details of the free webinar and to register for the event, please copy and paste the following link into your internet browser:

About Actinogen Medical

Actinogen Medical (ACW) is an ASX-listed, biotechnology company developing a novel therapy for neurological and neuropsychiatric diseases associated with dysregulated brain cortisol. There is a strong association between cortisol and detrimental changes in the brain, affecting cognitive function, harm to brain cells and long-term cognitive health.

Cognitive function means how a person understands, remembers and thinks clearly. Cognitive functions include memory, attention, reasoning, awareness and decision-making.

Actinogen is currently developing its lead compound, Xanamem, as a promising new therapy for Alzheimer's Disease and Depression and hopes to study Fragile X Syndrome and other neurological and psychiatric diseases in the future. Reducing cortisol inside brain cells could have a positive impact in these and many other diseases. The cognitive dysfunction, behavioural abnormalities, and neuropsychological burden associated with these conditions is debilitating for patients, and there is a substantial unmet medical need for new and improved treatments.

About Xanamem

Xanamem's novel mechanism of action is to block the production of cortisol inside cells through the inhibition of the 11 β -HSD1 enzyme in the brain. Xanamem is designed to get into the brain after it is absorbed in the intestines upon swallowing its capsule.

Chronically elevated cortisol is associated with cognitive decline in Alzheimer's Disease, and Xanamem has shown the ability to enhance cognition in healthy, older volunteers. Cognitive impairment is also a feature in Depression and many other diseases. Cortisol itself is also associated with depressive symptoms and when targeted via other mechanisms has shown some promise in prior clinical trials.

The Company has studied 11 β -HSD1 inhibition by Xanamem in more than 300 volunteers and patients, so far finding a statistically significant improvement in working memory and attention, compared with placebo, in healthy, older volunteers in two consecutive trials and clinically significant improvements in patients with biomarker-positive mild AD. Previously, high levels of target engagement in the brain with doses as low as 5 mg daily have been demonstrated in a human PET imaging study. A series of Phase 2 studies in multiple diseases is being conducted to further confirm and characterize Xanamem's therapeutic potential.

Xanamem is an investigational product and is not approved for use outside of a clinical trial by the FDA or by any global regulatory authority. Xanamem[®] is a trademark of Actinogen Medical.
